

The good, the bad, and the ugly

October 18, 2024

Abstract

1 Bruto

$\theta = \{x \in \mathbb{R} \mid \theta_{min} \leq x \leq \theta_{max}\}$: Latent trait levels, where θ_{min} is the minimum value of θ and θ_{max} is its maximum value (non sono sicura della x)

$||\theta||$: cardinality of the latent trait

$$\forall Q \in \mathcal{Q} = 2^B \setminus \{\emptyset, B\},$$

$$1. \mathbf{TIF}^Q = \frac{\sum_{i \in Q} IIF_i}{||Q||}$$

$$2. \bar{\Delta}_{\mathbf{TIF}^Q} = mean(|\mathbf{TIF}^* - \mathbf{TIF}^Q|) \text{ ho dei dubbi su questa notazione. la media è calcolata attraverso i valori di theta. In alternativa a questa notazione: } \bar{\Delta}_{\mathbf{TIF}^Q} = \frac{|\mathbf{TIF}^* - \mathbf{TIF}^Q|}{||\theta||}$$

$$Q_{bruto} = \arg \min_{Q \in \mathcal{Q}} \bar{\Delta}_{\mathbf{TIF}^Q}$$

2 Item Locating Algorithm

Siccome la filosofia di ILA e ISA è molto simile sarebbe carino trovare loro un nome comune e poi declinarle nelle loro specificità. ci pensiamo

Set up:

B : Item bank

$Q^k \subset B$: Set of item indexes selected for inclusion in the STF up to iteration k

\mathbf{TIF}^* : TIF target

D : Item selected at each iteration

$\mathbf{PIF}_D^k = \frac{\sum_{i \in Q^k \cup \{D\}} IIF_i}{||Q^k \cup \{D\}||}$, provisional mean tif at iteration k , including the item selected in D^k

$||Q^k||$: cardinality of Q^k at iteration k

At $k = 0$: $\mathbf{PIF}_D^0 = (0, 0, \dots, 0)$, $Q^0 = \emptyset$, $D^0 = \emptyset$,

$$1. \theta_{target} := \arg \max |\mathbf{TIF}^* - \mathbf{PIF}_D^k|$$

$$2. D^k = \arg \min_{i \in B \setminus Q^k} |\theta_{target} - b_i|$$

$$3. \mathbf{PIF}_D^k = \frac{\sum_{i \in Q^k \cup \{D\}} IIF_i}{||Q^k \cup \{D\}||}$$

4. Termination Criterion: $|\mathbf{TIF}^* - \mathbf{PIF}_D^k| < |\mathbf{TIF}^* - \mathbf{TIF}^k|$:

- TRUE: $k := k + 1$, $Q^k = Q^{k-1} \cup \{D\}$, iterates 1-5 (Ho scritto $k - 1$ perché siccome ho scritto all'inizio che k si aggiorna e diventa $k + 1$ mi sembrava sensato)
- FALSE: The item in D does not contribute to reduce the distance from the TIF target, hence: $Q_{ISA} = Q^k$

3 Item Selecting Algorithm

Same as ILA but based on the Item Information Functions.

Set up same as ILA: B : Item bank

$Q^k \subset B$: Set of item indexes selected for inclusion in the STF up to iteration k

\mathbf{TIF}^* : TIF target

D : Item selected at each iteration

θ_{target} : theta target selected at each iteration

$\mathbf{PIF}_D^k = \frac{\sum_{i \in Q^k \cup \{D\}} IIF_i}{||Q^k \cup \{D\}||}$, provisional mean tif at iteration k , including the item selected in D

$||Q^k \cup \{D\}||$: cardinality of $Q^k \cup \{D\}$ at iteration k

At $k = 0$: $\mathbf{PIF}_D^0 = (0, 0, \dots, 0)$, $Q^0 = \emptyset$, $D^0 = \emptyset$,

1. $\theta_{target} := \arg \max |\mathbf{TIF}^* - \mathbf{PIF}_D^k|$
2. $IIF_{i \in B \setminus Q^k} = a_i^2 P(\theta_{target}, a_i, b_i) [1 - P(\theta_{target}, a_i, b_i)]$
3. $D := \arg \min_{i \in B \setminus Q^k} |\theta_{target} - IIF_i|$
4. $\mathbf{PIF}_{D^k} = \frac{\sum_{i \in Q^k \cup \{D\}} IIF_i}{||Q^k \cup \{D\}||}$
5. Termination Criterion: $|\mathbf{TIF}^* - \mathbf{PIF}_D^k| < |\mathbf{TIF}^* - \mathbf{TIF}^k|$:

- TRUE: $k := k + 1$, $Q^k = Q^{k-1} \cup \{D\}$, iterates 1-5 (Ho scritto $k - 1$ perché siccome ho scritto all'inizio che k si aggiorna e diventa $k + 1$ mi sembrava sensato)
- FALSE: The item in D does not contribute to reduce the distance from the TIF target, hence: $Q_{ISA} = Q^k$

4 Frank

The setup is like the one of ILA and ISA:

B : Item bank

Q^k : set of items selected at iteration k

D : provisional item selected at each iteration

PIF: provisional mean tif

At $k = 0$, $\mathbf{PIF}^0 = (0, 0, \dots, 0)$, $Q^0 = \emptyset$, iterate

1. $A^k = B \setminus Q^k$ (sets of available items at iteration k)
2. $\forall i \in A^k, \mathbf{PIF}_i^k = \frac{\mathbf{TIF}^k + \mathbf{IF}_i}{||Q^k|| + 1}$
3. $D = \arg \min_{i \in A^k} |\mathbf{TIF}^* - \mathbf{PIF}_i^k|$
4. Termination criterion: $|\mathbf{TIF}^* - \mathbf{PIF}_D^k| < |\mathbf{TIF}^* - \mathbf{TIF}^{k-1}|$:
 - If true, $k := k + 1$, $Q^k = Q^{k-1} \cup \{D\}$, restart from 1 **C'è il meno 1 per la stessa ragione scritta per ILA e ISA**
 - If false, stops, $Q_{Frank} = Q^k$
